TITLE : OPTICAL OUTPUT DUTY ADJUSTING
CIRCUIT FOR ELECTRIC-OPTICAL
SIGNAL CONVERTER

ABSTRACT : PROBLEM TO BE SOLVED: To provide the adjusting circuit which can always keep the output light at the desired duty of 100% with no intervention of man power.

SOLUTION: An optical output duty adjusting circuit 1 is added to an electric/ optical signal converter 10 consisting of a data signal duty adjusting part 2, a drive part 3 which receives the output of the part 2 and generates a drive current and a laser diode 4 which emits the light by receiving the drive current from the part 3. Then the circuit 1 consists of a duty variance detection means 21 which monitors the output light of the diode 4 and detects the variance of duty of the data signal, and a duty setting means 22 which produces a duty adjusting signal accordant with the detected duty variance and feeds the adjusting signal back to the part 2.
